– preview version –

Abstract

`eqnlines` is a L^AT_EX 2 ε package providing a framework for typesetting single- and multi-line equations which extends the established equation environments of L^AT_EX and the `amsmath` package with many options for convenient adjustment of the intended layout. In particular, the package adds flexible schemes for numbering, horizontal alignment and semi-automatic punctuation, and it improves upon the horizontal and vertical spacing options. The extensions can be used and adjusted through optional arguments and modifiers to the equation environments as well as global settings.

1 Introduction

Typesetting mathematical equations is an undisputed strength of \TeX . \LaTeX improved the overall management of display equations, for instance by providing optional numbering. It also added elementary functionality for multi-lined equations with alignment. Some of its deficiencies were addressed by the multi-line equation environments of the package `amsmath` which have become an established standard for these purposes.

The package `eqnlines` builds upon and extends the functionality of the \LaTeX and `amsmath` equation environments with some new features as well as convenient options to adjust the layout where needed. The main additions are as follows:

- Equation numbers can be assigned to individual lines (as for `align` and `gather`) or once for the multi-line equation block (as for `multiline`). In the former case, a sub-numbering scheme can be applied (as through `subequations`). In the latter case, the position can be assigned to a specific line (first/middle/last/chosen). Moreover, equation numbers can be turned on and off by commands, and they can be triggered by setting a label.
- The vertical spacing above and below single- and multi-line equations of \LaTeX and `amsmath` can be somewhat variable, hard to control and even resistive in certain situations. The package implements clearer structures controlling the vertical spacing, including proper dependency on the text line above and ways to adjust the spacing.

- The framework introduces a scheme which semi-automatically inserts punctuation, e.g. ‘.’ or ‘,’, at the end of the following (or every) equation environment. Punctuation can also be inserted at every alignment column or equation line including the possibility to prepend a certain spacing.
- Next to `\[... \]` as an alias for the single-line `equation` environment, the package uses `\<... \>` as an alias multi-line equations.
- The horizontal alignment and indentation of equation lines can be adjusted via a scheme or on a line-by-line basis.
- The alignment marker can be placed before or after the equation signs while maintaining proper spacing to symbols before and after it. This simplifies the construction of continuing equations in an aligned context.
- Equation lines are subject to shrinking of white space if the available space does not suffice (analogously to single-line equations).
- Most settings can be controlled via optional arguments and modifiers to the equation environment or via global settings. This includes switching between different types of equation environments, enabling or disabling numbering, adjusting vertical spacing, etc. This feature simplifies the adjustment and fine-tuning of equations towards the intended layout.
- Last but not least, the underlying `amsmath` code, originating from the `TEX` era and early `LATEX` years, has been redesigned with emphasis on clarity, readability, adjustability and maintainability (but at the cost of moderately higher resource consumption and moderately lower efficiency). Nevertheless, it remains `LATEX 2 ε` code.

The package represents a stand-alone implementation of an equations environment which is largely compatible with the established `LATEX` and `amsmath` environments `equation`, `multline`, `gather`, `align` and their variants. Hence, the package can be used instead of `amsmath` with no or minor modifications to the `LATEX` sources for single- and multi-line equations. It can also be used alongside `amsmath` including the `mathtools` extensions to make use of the additional maths typesetting features provided by these packages. In the latter case, the equation environments of `LATEX` and `amsmath` are either replaced or left in place while the `eqnlines` environments can be accessed using the alternate name `equations`.

2 Usage

Notice regarding package version v0.5: Please note that this package is still in a development and testing stage in the present version. This mainly applies to the documentation of features and code: Currently, the documentation is basic and minimal without extensive coverage of all features and settings, and it lacks desirable illustrations and examples.

It is likely that some features of the package do not work to full extent, and that the package will not cooperate well with other packages. Therefore, please report any malfunctions that you may notice.

Therefore, it is likely that internal macros and mechanisms will change. It is also conceivable that the public interface will change in minor but relevant ways in order to accommodate for important adjustments or additional features. It is intended that such changes would only require minor adaption of document sources that use an early version of this package.

To use the `eqnlines` package add the command

```
\usepackage{eqnlines}
```

to the preamble of the L^AT_EX document. To use unrelated features of the `amsmath` package or of the `mathtools` extension, it makes sense to load these packages *before* `eqnlines`.

2.1 Equations Environment

`equations` (*env.*) The package supplies a main maths environment called `equations` which accepts a comma-separated list of optional parameters ‘`[opts]`’:

```
\begin{equations}[opts]_
...
\end{equations}
```

Furthermore, the environment accepts some modifiers (like the star modifier ‘*’ for many other L^AT_EX macros) which will be explained further below. These follow the scheme `{ !t~ !t* !t! !o !e{@} }` according to the syntax of `\NewDocumentCommand`.

We note that the equations environment should be started with a white space character ‘_’ which provides a clear separation from optional arguments ‘`[opts]`’ and/or modifiers which must immediately follow the environment declaration `\begin{equations}`.

`single` (*key*) The environment has three principal modes of operation which are selected by setting an `lines` (*key*) optional argument as follows:

`columns` (*key*)

purpose	single-line equation	stacked equation(s)	aligned equations
name	<code>single</code>	<code>lines</code>	<code>columns</code>
alt. names	<code>equation, eq, 1</code>	<code>gather, ga, ln, ~</code>	<code>align, al, col, @</code>
symbolic	<code>\[...]</code>	<code>\<~... \></code>	<code>\<... \></code>
amsmath env.	<code>equation</code>	<code>gather, multiline</code>	<code>align</code>
columns	—	<code>single</code>	multiple, aligned
alignment	adjustable	adjustable	alternating right/left
parsing	single, direct	two passes	two passes
numbering	on/off	off/single/multiple	off/single/multiple

The aligned mode more or less encompasses all three modes, and the stacked mode with only a single line is more or less just a single equation. However, the more complex forms also come along with some restrictions, hence, it makes sense to use the appropriate mode for the intended equation content. For instance, a single equation simply reads the equation input once, while the multi-line equation environments parse the environment body twice which can potentially disrupt some other functionality that is included in the body. Furthermore, the horizontal adjustment options are very restricted in aligned mode, and therefore the aligned form can automatically reduce to the stacked form (with right alignment) if only a single column is provided (no ‘&’s).

`\[...]` The package offers several alternative names for the same mode as well as a symbolic short `\<... \>` form `\<... \>` extending the L^AT_EX display equation form `\[...]` to multi-line equations.

`~` (*key*) Here, the tilde ‘~’ in `\<~... \>` is a modifier character which acts as a short form for the `sqropt` (*key*) optional argument `lines` selecting the lines mode. Both short forms can be customised by `angopt` (*key*) setting default arguments via the global options `sqropt={opts}` and `angopt={opts}`. Both default arguments are preset to `nonumber` which disables equation numbering, see section 2.2.

`equation` (*env.*) The package also supplies or overwrites the `amsmath` environments `equation`, `multiline`, `multline` (*env.*) `gather`, `align` and `flalign` including their starred variants but neither the `alignat` alter-native forms nor `split`. It is possible to define further equation environments *env* with a `align` (*env.*) predefined set of options *opts* using:

```
\[re]newenvironment{env}{{\leqnaddopt{opts}}\equations}{\endequations}
```

2.2 Numbering

`numberline (key)` The package extends the established interface of L^AT_EX and the `amsmath` package for labelling equations with numbers or with manually assigned tags. For multi-line equations, there are two distinct modes of operations: individual labelling of the equation lines or one overall number/tag for the whole block of equations. The modes are selected by an optional argument `numberline=mode` as follows:

name	alt.	description	preset
<code>none</code>	<code>n</code>		preset off
<code>all</code>	<code>a</code>	individual lines	preset on
<code>sub</code>	<code>s</code>		subequations (a, b, c, ...)
<code>first</code>	<code>f</code>		first line
<code>last</code>	<code>l</code>		last line
<code>middle</code>	<code>m</code>	single number	middle line
<code>out</code>	<code>o</code>		last/first line for right/left tags
<code>in</code>	<code>i</code>		first/last line for right/left tags
<code>here</code>	<code>h</code>		line indicated by <code>\numberhere</code>

`\nonumber` Numbering can be turned on and off (for individual lines or for the block as a whole depending on the mode) by means of:

`\nonumber` and `\donumber`

* (key) Alternatively, the numbering can be disabled or enabled for the block using modifiers (which ! (key) must be placed *before* further optional arguments):

`\[*... \]` and `\[!... \]`

This allows to define a default behaviour and specify exceptions where they may occur. The star modifier following directly the environment declaration replaces the starred form of environments (`equation*`, etc.).

`\numberhere` The placement of a single number for an equation block can be adjusted by:

`\numbernext`

`\numberhere` and `\numbernext`

The former macro overrides the position to the present line. The latter macro defers the number to the next line, e.g. if an equation is broken into several lines and the last one should receive the number tag.

`\label` Equation numbers can receive L^AT_EX labels as usual and they can be turned into manually assigned tags using the established macros:

`\label{label}` and `\tag[*]{tag}`

Note that a label and a tag will always apply to the next number that will be printed, and only a single label and/or tag may be specified for it. For example, if the present line has no numbering, but the following line does, `\label` or `\tag` will apply to the following line. The macros `\label` and `\tag` can also be instructed to automatically enable numbering for the present line or block (`\donumber`). By default, numbers are triggered for `\tag`, but not for `\label` reflecting the behaviour set forth by `amsmath`. By enabling triggering for `\label`, numbers will be produced only if they have a chance of being referenced.

`\label (key)` The equations environment provides an alternative means to specify labels and tags within `\tag (key)` the optional arguments `[opts]` or via the modifier `@{label}` (which may follow further optional arguments):

```
label={label},      tag[*]={tag},          \[@{label}...@]
```

In particular, in subequations mode (`sub`), the optional argument `label` can be used to assign a label to the parent number addressing the whole equation block.

`\raisetag`

`taglayout (key)` The typesetting of equation numbers and tags passes through two macros, one which defines `tagform (key)` the layout and another one which adds a decoration (brackets). These two methods can be adjusted via the options:

```
taglayout[*]={code} and tagform={l{code}r} or tagform*={code}
```

Here, `code` is some macro code that references the argument ‘#1’ containing the number or tag, and `l` and `r` can be opening and closing brackets for the tag presentation.

`\eqref` The macro `\eqref` is the standard method for referring to equation numbers via their label. This method also uses the layout defined above.

2.3 Horizontal Adjustment

`margin (key)` The horizontal alignment of columns is fixed for aligned multi-line equations: Each pair of subsequent columns forms a unit which is aligned at the intermediate alignment marker `maxcolsep (key)` ‘&’. These columns are distributed evenly over the available horizontal space. Here, the outer space left and right of the set of columns can be treated on equal footing to the space between the columns (option `margins=on`), but it can be eliminated so that the outer columns are pushed right to the margin (option `margins=off`). In addition, a minimum and maximum width can be specified for the column separation (`mincolsep=dimen` and `maxcolsep=dimen`). By default, no maximum column separation is set (`maxcolsep*`), and all horizontal space is used, otherwise a value of `2em` ($\equiv \quad$) is suggested with the minimum separation set to `1em` ($\equiv \quad$) by default.

For stacks of equations including single equations, there is just a single alignment column whose horizontal alignment can be adjusted via a shape scheme or by manually adjusting individual lines. A shape scheme determines the horizontal alignment for each line and it is specified by the optional argument `shape=mode` as follows:

name	alt.	shape	alignment
<code>default</code>	<code>def</code>	uniform	default
<code>left</code>	<code>l</code>		left
<code>center</code>	<code>c</code>	uniform	central
<code>right</code>	<code>r</code>		right
<code>first</code>	<code>indent, rc</code>	first/rest	first line indented
<code>hanging</code>	<code>outdent, lc</code>	first/rest	first line hanging
<code>steps</code>	<code>lcr</code>	first/intermediate/last	left/centre... centre/right

Note that the steps shape comes to use in the `amsmath` environment `multiline`. The alignment preset can be adjusted for individual lines by the macros:

```
\shoveleft[*|!|[dimen]],   \shovecenter,   \shoveright
```

In contradistinction to `amsmath`, these macros do not require to specify the cell contents `indent (key)` as their argument (but there is no harm in doing so). The macro `\shoveleft` also accepts the modifiers ‘*’ or ‘!’ for indentation or hanging indentation by the standard indentation amount (`indent=2em`) or an optional argument `[indent]` specifying a variable amount of indentation.

- padding** (*key*) Note that (hanging) indentation requires to add some padding around the equations block via **padleft** (*key*) the optional argument **padding|padleft|padright[={dimen}]** or **padmax** to extend padding **padright** (*key*) to the whole line. Note that **indent*={dimen}** sets the default indentation amount and the **padmax** (*key*) left padding at the same time.
- layout** (*key*) Finally, the overall layout can be adjusted between central and left alignment via **center** (*key*) **layout=center**, **layout=left** or **center, left** for short.
- left** (*key*) In central alignment mode, there is the option of imposing a tag margin **tagmargin={dimen}** **tagmargin** (*key*) which allocates some space to the tag such that equation content is centred in the remaining horizontal space.
- leftmargin** (*key*) In left alignment mode, all equations are left aligned to a left margin (**leftmargin** initialised **minleftmargin** (*key*) to the first level of enumerations and itemisations). Depending on the situation, the left **maxleftmargin** (*key*) margin may be reduced or extended to **minleftmargin** or **maxleftmargin**, respectively.
- marginbadness** (*key*) Finally, we note that within single and stacked equations, very long equations that do not **maxbadness** (*key*) fit the available horizontal space are subject to shrinking attempts. In other words, TeX will attempt to shrink the glue contained in the equation line to make it fit. This shrinking can be controlled by the two parameters **marginbadness** and **maxbadness** accepting integer values. The former is used for trying to shrink onto certain horizontal margins which are otherwise reserved for tags; the latter is used for using the maximal horizontal space which also raises or lowers the equation tag if needed. Small values prevent shrinking and higher values allow for more compression.

2.4 Punctuation

Extending proper punctuation across equations is a delicate matter, and maintaining it while redacting the text certainly takes more attention to detail than many author are willing to afford. A contributing factor is that punctuation marks are harder to spot alongside equation context and somewhat out of place anyway.

- \eqnpunctmain** The package supplies a semi-automatic scheme by which equations are terminated by a **\eqnpunct** specific punctuation mark. Punctuation marks are set by:

```
punct (key)
      \eqnpunctmain{punct}      \eqnlineset{punct={punct}}
      \eqnpunct{punct}          \eqnadopt{punct={punct}}
      \[[punct={punct}] ... \]
```

The former two forms set and enable a default punctuation mark; the middle two forms set the punctuation mark for the next equation environment in line; the final form applies to the equation environment only. For example, one might declare ‘**\eqnpunctmain.**’ to terminate all equations with a period ‘.’. The default behaviour can be adjusted to a comma ‘,’ for an individual equation by declaring ‘**\eqnpunct,**’ before the equation (i.e. at the end of the textual phrase to which the punctuation mark belongs) or by using the optional argument **[punct={,}]**. Likewise, **\eqnpunct{}** and **[punct={}]** eliminate a preset punctuation.

- punctsep** (*key*) For convenience, one may also specify a desired space (or any other sequence) preceding the punctuation by **[punctsep={sep}]**, e.g. **sep=\,** or **sep=_**.

- \eqnpunctcol** For multi-line equations, there are two further levels of default punctuation for terminating **\eqnpunctline** columns and lines which are specified via the macros **\eqnpunctcol** and **\eqnpunctline** or **punctcol** (*key*) the optional arguments **punctcol** and **punctline**. A punctuation item may also be handed **punctline** (*key*) on to the next lower level of punctuation via the starred forms **punct*** and **punctline***.

2.5 Math Classes at Alignment

Alignment in multi-line equations breaks equations into components before and after the alignment position. Unfortunately, this also interrupts \TeX 's math spacing mechanism which is based on the math classes assigned to the characters, and there appears to be no direct way of determining the math class to the previous letter. Therefore, one has to make some assumptions on the letters that will surround the alignment marker ‘&’ in order to obtain the appropriate spacing also across the alignment.

The `amsmath` environment `align` assumes that the left column ends with an ordinary character. This leads to the correct spacing when an equation $a = b + c$ is broken before the equals relation as `a&=b+c`, and also if an equation sequence continues on the next line as `\\\&=d-e`. However, it is difficult to achieve the right spacing if the right-hand side is to be broken into several lines: For instance, `\\\&.+f` aligns the subordinate binary operation with the equals sign (which may be undesirable). Instead placing a phantom equals sign is an effort that somewhat disrupts the readability of the code.

`class (key)` The package implements a more flexible assignment of math classes at the alignment. The `ampeq (key)` above default behaviour is invoked by the optional argument `class=ampeq` (or `ampeq` for `eqamp (key)` short). The optional argument `class=eqamp` (or `eqamp` for short) imposes math classes at the alignment such that an equation sign should be placed just before the alignment. Concretely, it inserts `\mathrel{}` classes just before and after the alignment marker. Furthermore, in case of an empty left alignment cell, the leading math class is changed to `\mathord{}` so that a following binary operator is not interpreted as a unary one.

`classout (key)` Math classes just before and after alignment can be adjusted freely by the optional arguments:

`classin (key)`

`classout={class}, classin={class}, classlead={class}.`

The parameter `classlead` determines the math class just after the alignment if the cell before alignment is empty.

For example, the following two expressions produce identical output:

```
\<[ampeq] a &= b+c \\ &= d-e \\ &\mathrel{=}\phantom{=} +f \> 1  
\<[eqamp] a =& b+c \\ =& d-e \\ & +f \>
```

2.6 Vertical Spacing

Display equations in \TeX are considered to be part of the surrounding text. Hence, the vertical spacing depends on the surrounding text, in particular on the width and depth of the last line of text. Due to this influence it can be difficult to control the spacing accurately. The package adds several options to control the vertical spacing, and it also implements a uniform behaviour for all types of equations.

The spacing of equations to the surrounding text is a combination of several aspects:

First, \TeX inserts some interline spacing according to its rules. The amount depends on the depth/height of the surrounding text and the height/depth of the math content. The former typically takes rather uniform values, whereas the latter can range wildly with the context (plain equations vs. fractions and matrices). As equations are normally surrounded by a relatively large amount of glue, it makes sense to reduce the dependency on the height/depth of math content. Therefore, the package makes equation environments appear to the surrounding text as a line with a fixed height and depth, and thus interline glue merely fills

`displayheight (key)` some potential gaps of the surrounding text. The apparent height and depth are defined by `displaydepth (key)` `displayheight` and `displaydepth` which default to the dimensions of a strut.

Second, the spacing of display equations depends on the width of the previous line of text. If the math content fits well into the available horizontal space, the display equation is called short and less glue is needed above the equation. The package implements this basic TeX feature for all single- and multi-line equation environments. TeX also reduces the amount of glue below short equations (potentially to make their spacing appear more uniform). The package allows to adjust the spacing for short equations via the global option `shortmode={mode}` where `mode` takes the values:

name	reduced glue
<code>off</code>	disabled
<code>above</code>	above short equations
<code>belowone</code>	also below short single-line equations
<code>belowall</code>	also below all short single-line equations

`short (key)` Short and long amounts of glue can also be enforced for individual equation environments
`long (key)` via the optional arguments `short` and `long` taking the values `above`, `below` or `both`.

Third, the package provides several means to adjust the glue around equations:

`noskip (key)` Next to `short` and `long` the spacing above and below equation environments can be reduced
`medskip (key)` to some other fixed smaller amount via `medskip` or removed altogether via `noskip`. These keys also take the values `above`, `below` or `both`.

`par (key)` The key `par` controls to whether the equations environment end in horizontal mode (value `cont`) or in vertical mode (value `par`, default) with a dedicated amount of glue `belowparskip`. An environment can also end in vertical mode without interline skip (value `top`) and with glue `belowtopskip`.

`...skip (key)` Variable amounts of skip can be set via `aboveskip` and `belowskip` or `skip` for both simultaneously. In addition, the package extends the `\vspace` mechanism of LATEX to equation bodies where it adds vertical space below the next equation line or below the equation environment. Additional glue can be added above or below equation environments by means of the options `abovespace` and `belowspace`.

The package also maintains several global vertical space settings `aboveposskip` and
`...skip (key)` `belowposskip` (sometimes `posskip` for both):

<code>...posskip</code>	both	description
<code>...long...</code>	<code>skip</code>	standard amount of glue
<code>...short...</code>	—	reduced glue for short equations
<code>...cont...</code>	—	glue when issued from an empty <code>\noindent</code> paragraph
<code>...par...</code>	—	glue when starting a paragraph (in vertical mode)
<code>...top...</code>	—	glue when issued at the top of vertical list
<code>...med...</code>	<code>medskip</code>	medium amount of glue
<code>...tag...</code>	<code>tagskip</code>	glue for outer raised/lowered tags
<code>...medtag...</code>	<code>medtagskip</code>	glue for outer raised/lowered tags with med
<code>...partag...</code>	—	glue for outer raised/lowered tags with par

`...mode (key)` The situations `cont`, `par` and `top` use the respective glue `above...skip` above the equations. By default they use `belowlongskip` below the equations, but this setting may be adjusted by the global option `posmode` with the values:

name	reduced glue
<code>long</code>	regular amount below equations
<code>short</code>	short amount below equations
<code>cont</code>	<code>cont</code> amount below equations
<code>par</code>	end the paragraph (only <code>parmode</code> and <code>topmode</code>)
<code>top</code>	end the paragraph without interline skip (<code>topmode</code> only)

spread (*key*) Likewise, the spacing between the lines of a multi-line equation environment can be adjusted
strut (*key*) via **spread={dimen}** which defaults to `\jot\equiv3pt`. In addition, all equation lines and tags
struttag (*key*) are supplied with struts to ensure a minimum height and depth. The latter behaviour is controlled by the boolean switches **strut** and **struttag**.

displaybreak (*key*) Finally, the breaking of multi-line equations across pages can be controlled as follows: The `\displaybreak` setting **allowdisplaybreaks** taking values 0 (never) through 4 (permissive) controls the permissivity of page breaks within multi-line equations. The optional argument **displaybreak** taking values 0 (do not) through 4 (enforce) suggests a break just *above* the equation environment. The command `\displaybreak` with values 0 through 4 suggests a break below the current line or below the equation environment.

2.7 Further Environments

The package supplies some additional environments:

equationsbox (*env.*) The package provides a boxed equation environment **equationsbox** which can be used within **margin** (*key*) arbitrary math content. It works analogously to **equations** including optional arguments **marginleft** (*key*) and modifiers, but it offers a reduced range of functionality such as (evidently) no numbering. Additional arguments are given by **margin**, **marginleft**, **marginright** which specify additional margin space around the equations box.

subequations (*env.*) The environment **subequations** group equations contained in the body with a common **subeqtemplate** (*key*) primary equation number and an extra level of numbering (typically: a, b, c, ...). The numbering layout can be controlled via **subeqtemplate**. For instance, the default behaviour of adding lowercase latin letters to the parent equation number (`\theparentequation`) is achieved by:

```
subeqtemplate=\theparentequation\alph{equation}}
```

intertext (*env.*) The environment **intertext** (or equivalently the macro `\intertext`) injects a (short) line `\intertext` of text into a multi-line equation while preserving the equation alignment across the text. The **intertext** environment must replace the end of line marker ‘`\``’ between two lines of the equation (to avoid blank lines). The environment accepts several of the vertical spacing adjustments as an optional argument.

2.8 General Options

`\eqnlineset` Options of general nature can be selected by the commands:

```
\usepackage[opts]{eqnlines}
or \PassOptionsToPackage{opts}{eqnlines}
or \eqnlineset{opts}
```

`\PassOptionsToPackage` must be used before `\usepackage`; `\eqnlineset` must be used afterwards. *opts* is a comma-separated list of options.

The package supplies the following general settings:

option	description
<code>defaults=classic</code>	mimic classic L ^A T _E X/amsmath (layout and dimensions)
<code>defaults=eqnlines</code>	eqnlines layout with fontsize-relative dimensions
<code>rescan</code>	rescan environment body to allow special commands (e.g. <code>\verb</code>)
<code>linesfallback</code>	single column in align mode reverts to lines mode
<code>ampproof</code>	equip optional argument parsing with protection for &
<code>crerror</code>	invoke an error when ‘ <code>\`</code> ’ is used in a single equation

2.9 Feature Selection and Package Options

The following few settings can only be specified when loading the package, not via `\eqnlineset`:

option	type	description
<code>equation</code>	bool	provide/overwrite <code>equation</code> and <code>\[...]</code>
<code>amsmath</code>	bool	provide/overwrite <code>amsmath</code> environments and macros
<code>ang</code>	bool	provide <code>\<...></code>

If the above settings are explicitly disabled, the package will only supply the general purpose environment `equations` and its boxed cousin `equationsbox`. In that case, the specific equation environments and other features can be activated by the command:

```
\eqnlinesprovide{features}
```

features is a comma-separated list of features:

feature	description
<code>env</code>	provide/overwrite environment <code>env</code> : <code>equation</code> , <code>gather</code> , <code>multiline</code> , <code>align</code> , <code>flalign</code> <code>multlined</code> , <code>gathered</code> , <code>aligned</code> , <code>subequations</code>
<code>env=name</code>	provide environment <code>env</code> as <code>name</code>
<code>sqr</code>	provide <code>\[...]</code>
<code>ang</code>	provide <code>\<...></code>
<code>cmd</code>	provide/overwrite macro <code>\cmd</code> : <code>eqref</code> , <code>notag</code> , <code>thetag</code> , <code>allowdisplaybreaks</code> , <code>numberwithin</code>
<code>tagform</code>	provide/overwrite macro <code>\tagform@</code>
<code>maketag</code>	provide/overwrite macro <code>\maketag@@@</code>

3 Information

3.1 Copyright

Copyright © 2024–2025 Niklas Beisert

Based on the latex package amsmath: Copyright © 1995, 2000, 2013 American Mathematical Society; 2016–2024 LaTeX Project and American Mathematical Society.

This work may be distributed and/or modified under the conditions of the L^AT_EX Project Public License, either version 1.3 of this license or (at your option) any later version. The latest version of this license is in <https://www.latex-project.org/lppl.txt> and version 1.3c or later is part of all distributions of L^AT_EX version 2008 or later.

This work has the LPPL maintenance status ‘maintained’.

The Current Maintainer of this work is Niklas Beisert.

This work consists of the files `README.txt`, `eqnlines.ins` and `eqnlines.dtx` as well as the derived files `eqnlines.sty` and `eqnlines.pdf`.

3.2 Credits

This package is based on the L^AT_EX package `amsmath` (initially named `amstex`) which in turn is based on the T_EX macro system `amstex` written by Michael Spivak. The initial work of porting `amstex` to L^AT_EX was done in 1988–1989 by Frank Mittelbach and Rainer Schöpf. In

1994 David M. Jones added the support for flush-left layout and did extensive improvements to the align family of environments and to the equation number handling in general. Michael Downes at the AMS served as coordinator for the efforts of Mittelbach, Schöpf, and Jones, and has contributed various bug fixes and additional refinements over time. Since 2016, the package has been maintained by the LaTeX Project with contributions by the above and David Carlisle.

This package has been forked from `amsmath` in accordance with the LPPL, particularly paragraph 6. The original package `amsmath` is available at CTAN within `latex-amsmath`. It uses the basic mechanisms for processing numbered multi-line equations as developed in `amsmath` (environments `equation`, `align`, `gather`, `multiline`, `gathered`, `aligned` and related), as well as code implementing these mechanisms. It differs from `amsmath` in the following aspects:

- The implementations of `split` and methods unrelated to multi-line equations and equation numbering have been dropped.
- Code has been restructured, macros have been renamed and extended.
- Numbering and horizontal adjustment schemes have been unified and extended.
- Options for math classes surrounding the alignment have been added.
- A punctuation scheme has been added.
- Vertical spacing has been redesigned.
- Optional parameters have been added to environments.
- Various configuration options and layout settings have been added.
- Cooperation with `hyperref`, `showkeys` and `amsmath` has been included into the package.

3.3 Files and Installation

The package consists of the files:

<code>README.txt</code>	readme file
<code>eqnlines.ins</code>	installation file
<code>eqnlines.dtx</code>	source file
<code>eqnlines.sty</code>	package file
<code>eqnlines-dev.sty</code>	package file (development version)
<code>eqnlines.pdf</code>	manual

The distribution consists of the files `README.txt`, `eqnlines.ins` and `eqnlines.dtx`.

- Run (pdf)TeX on `eqnlines.dtx` to compile the manual `eqnlines.pdf` (this file).
- Run TeX on `eqnlines.ins` to create the package `eqnlines.sty` and the developers version `eqnlines-dev.sty`. Copy the file `eqnlines.sty` to an appropriate directory of your TeX distribution, e.g. `texmf-root/tex/latex/eqnlines`.

3.4 Related CTAN Packages

The package is related to other packages available at CTAN:

- This package uses the package `keyval` to process the options for the package, environments and macros. Compatibility with the `keyval` package has been tested with v1.15 (2022/05/29).

- This package reproduces the math environments functionality of the package `amsmath`. The present code is based on `amsmath` v2.17t (2024/11/05). Compatibility with the `amsmath` package is maintained whether `eqnlines` is loaded before or after `amsmath`. By default, `eqnlines` will rename the math environments of `amsmath` with a prefix `ams...` and overwrite them with its own implementations. Alternatively, `eqnlines` may assign individual names to the maths environments and preserve the ones of `amsmath`. The other features provided by `amsmath` can be used.
- The package `mathtools` is a popular extension of the `amsmath` package. This package incorporates some of the features and improvements provided by the `mathtools` package. Compatibility with the `mathtools` package has been tested with v1.31 (2024/10/04), and it is maintained whether `eqnlines` is loaded before or after `mathtools`. Some features like adding a box and emphasising equations via `empheq` does not (yet) work.
- This package cooperates with the package `hyperref` to create anchors and references within the electronic document. Compatibility with the `hyperref` package has been tested with v7.011 (2024/11/05).
- This package supports the display of labels and references through the package `showkeys`. Compatibility with the `showkeys` package has been tested with v3.21 (2024/05/23).

3.5 Feature Suggestions

The following is a list of features for consideration towards future versions of this package. Their potential use may range between useful and niche; and their difficulty between easy and impossible:

- a proper manual
- complete code documentation
- sample document

3.6 Revision History

v0.6: 2025/03/11

- preliminary pdf tagging support (<https://latex3.github.io/tagging-project/>)
- classic L^AT_EX/`amsmath` vs. `eqnlines` presets
- changed vertical spacing schemes and added further options
- supplied dimensions processed by `\glueexpr`
- more independent of `amsmath` structures
- internal reorganisations

v0.5: 2025/02/25

- preview version published on CTAN

A Implementation

The appendix documents the various components of the present package.

The code for the package is based on the `amsmath` package, see section 3.1 and section 3.2. It was forked at version v2.17t dated 2024/11/05. Most of the code was substantially redesigned (macros renamed, reshuffled, enhanced), but many of the underlying mechanisms were preserved. The documentation thus contains excerpts from the `amsmath` package documentation explaining some details of the implementation.

Please note that the documentation is completed only for few sections in the present version. Various open issues are remarked.

B General Support

In the following we describe general purpose supporting routines.

B.1 Development Messages

The package offers a version `eqnlines-dev` for development and debugging purposes. It outputs extra information on the current location within the code in order to track progress. The extra lines for the development version are indicated as ‘(dev)’ in the implementation documentation:

```

1 (dev)\def\eql@dev#1{\PackageInfo{eqnlines-dev}{#1}}
2 (dev)\def\eql@dev@start#1{\eql@dev{starting \string#1}}
3 (dev)\def\eql@dev@enter#1{\eql@dev{entering \string#1}}
4 (dev)\def\eql@dev@leave#1{\eql@dev{ leaving \string#1}}
5 (dev)\def\eql@dev@enterenv{\eql@dev{entering \@currenvir}}
6 (dev)\def\eql@dev@leaveenv{\eql@dev{ leaving \@currenvir}}
7 (dev)\def\eql@dev@in#1#2{\eql@dev{ \space within \string#1 #2}}

```

B.2 Look-Ahead in Alignment

Scanning for optional arguments [...] or modifiers such as ‘*’ using the L^AT_EX `\@ifnextchar` mechanism has two challenges within aligned equations: a square bracket or star may well be part of the intended mathematical expression and the look-ahead could trip upon an alignment character ‘&’ which inadvertently triggers to enter the next alignment column.

`\eql@ifnextchar@loose` To address the first challenge, we can force the special characters to follow immediately the macro invocation. For clarify, we copy L^AT_EX’s original `\@ifnextchar` in `\kernel@ifnextchar` which skips over spaces as `\eql@ifnextchar@loose`. We replicate the `amsgen` version `\new@ifnextchar` that does not skip over spaces as `\eql@ifnextchar@loose`. The space before #1 allows to look-ahead for spaces as well:

```

8 \let\eql@ifnextchar@loose\kernel@ifnextchar
9 \long\def\eql@ifnextchar@tight#1#2#3{%
10   \let\reserved@d= #1%
11   \def\reserved@a{#2}%
12   \def\reserved@b{#3}%
13   \futurelet\@let@token\eql@ifnch@tight
14 }
15 \def\eql@ifnch@tight{%
16   \ifx\@let@token\reserved@d
17     \let\reserved@b\reserved@a
18   \fi
19   \reserved@b
20 }

```

TODO: describe

```

21 \begingroup
22   \makeatother
23   \let\tmp=%
24   \makeatletter
25   \global\let\eql@atxii\tmp
26 \endgroup

```

`\eql@ifnextgobble@...` We introduce a collection of look-ahead macros which do or do not skip over spaces. The `\eql@ifstar@...` macros `\eql@ifstar@...` and `\eql@testopt@...` replicate the L^AT_EX counterparts `\@ifstar` and `\@testopt`. The macros `\eql@ifnextgobble@...` work like `\@ifnextchar`, `\eql@teststaropt@...` but also gobble the specific character if found; one might define `\eql@ifstar@...` as `\eql@ifnextgobble@...*`. The macros `\eql@teststaropt@...` tests for combinations of '*' and optional arguments [...]:

```

27 \long\def\eql@ifnextgobble@loose#1#2{\eql@ifnextchar@loose#1{\@firstoftwo{#2}}}
28 \long\def\eql@ifnextgobble@tight#1#2{\eql@ifnextchar@tight#1{\@firstoftwo{#2}}}
29 \long\def\eql@ifstar@loose#1{\eql@ifnextchar@loose*{\@firstoftwo{#1}}}
30 \long\def\eql@ifstar@tight#1{\eql@ifnextchar@tight*{\@firstoftwo{#1}}}
31 \long\def\eql@ifat@loose#1#2{\eql@ifnextgobble@loose{#1}{#2}{%}
32   \eql@ifnextgobble@loose\eql@atxii{#1}{#2}}
33 \long\def\eql@ifat@tight#1#2{\eql@ifnextgobble@tight{#1}{#2}{%}
34   \eql@ifnextgobble@tight\eql@atxii{#1}{#2}}
35 \long\def\eql@testopt@loose#1#2{\eql@ifnextchar@loose[{{#1}{#1[{{#2}]}}}]{%}
36 \long\def\eql@testopt@tight#1#2{\eql@ifnextchar@tight[{{#1}{#1[{{#2}]}}}]{%}
37 \long\def\eql@teststaropt@loose#1#2#3{%
38   \eql@ifstar@loose{\eql@testopt@loose{#1}{#3}}{\eql@testopt@loose{#2}{#3}}}
39 \long\def\eql@teststaropt@tight#1#2#3{%
40   \eql@ifstar@tight{\eql@testopt@tight{#1}{#3}}{\eql@testopt@tight{#2}{#3}}}

```

`\eql@spbgrou` The second challenge is addressed by enclosing the look-ahead in spurious groups¹ which `\eql@spgroup` protect against triggering '&'. The macros `\eql@spbgrou` and `\eql@spgroup` open and `\eql@srbgroup` close a spurious group. For some reason, the look-ahead mechanism requires further `\eql@sregrou` protections by inserting `\relax` at the beginning and by resetting `\@let@token` at the end. These adjustments are included in the macros `\eql@srbgroup` and `\ers@spgroup`:

```

41 \def\eql@spbgrou{\iffalse{\fi\ifnum0='}\fi}
42 \def\eql@spgroup{\ifnum0='{\fi\iffalse}\fi}
43 \def\eql@srbgroup{\relax\iffalse{\fi\ifnum0='}\fi}
44 \def\eql@sregrou{\let\@let@token\relax\ifnum0='{\fi\iffalse}\fi}

```

`\eql@ampprotect` The macros `\eql@ampprotect` and `\eql@ampprotecttwo` inject the opening and closing of `\eql@ampprotecttwo` spurious groups into the look-ahead mechanism:

```

45 \long\def\eql@ampprotect#1#2{\eql@srbgroup#1{\eql@sregrou#2}}
46 \long\def\eql@ampprotecttwo#1#2#3{%
47   \eql@srbgroup#1{\eql@sregrou#2}{\eql@sregrou#3}}

```

`...@ampsafe` We introduce a collection of '&'-safe look-ahead macros:

```

48 \def\eql@ifnextchar@loose@ampsafe#1{%
49   \eql@ampprotecttwo{\eql@ifnextchar@loose#1}}
50 \def\eql@ifnextchar@tight@ampsafe#1{%
51   \eql@ampprotecttwo{\eql@ifnextchar@tight#1}}

```

¹See <https://www.latex-project.org/cgi-bin/ltxbugs2html?pr=latex/3040>,
<https://www.latex-project.org/cgi-bin/ltxbugs2html?pr=amslatex/1834> and
<https://tex.stackexchange.com/questions/9897/showcase-of-brace-tricks-egroup-iffalse-fi-etc>.

```

52 \def\eql@ifstar@loose@ampsafe{\eql@ampprotecttwo\eql@ifstar@loose}
53 \def\eql@ifstar@tight@ampsafe{\eql@ampprotecttwo\eql@ifstar@tight}
54 \def\eql@testopt@loose@ampsafe{\eql@ampprotect\eql@testopt@loose}
55 \def\eql@testopt@tight@ampsafe{\eql@ampprotect\eql@testopt@tight}
56 \def\eql@teststaropt@loose@ampsafe{\eql@ampprotecttwo\eql@teststaropt@loose}
57 \long\def\eql@teststaropt@tight@ampsafe{%
58   \eql@ampprotecttwo\eql@teststaropt@tight}

```

`\eql@amproof` We may want to replace L^AT_EX's definitions `\@ifnextchar`, `\@ifstar` and `\@testopt` to `\eql@amp revert` respect ‘&’ characters within aligned equations. This might make unrelated definitions with optional arguments and starred variants more robust in this context. The macro `\eql@amproof` overwrites the original definitions, and `\eql@amp revert` reverts the changes:

```

59 \let\eql@ifnextchar@org\@ifnextchar
60 \let\eql@ifstar@org\@ifstar
61 \let\eql@testopt@org\@testopt
62 \def\eql@amp revert{%
63   \let\@ifnextchar\eql@ifnextchar@org
64   \let\@testopt\eql@testopt@org
65   \let\@ifstar\eql@ifstar@org
66 }
67 \def\eql@amp proof{%
68   \let\@ifnextchar\eql@ifnextchar@loose@ampsafe
69   \let\@testopt\eql@testopt@loose@ampsafe
70   \let\@ifstar\eql@ifstar@loose@ampsafe
71 }

```

B.3 Error Messages

`\eql@error` Main error and warning message function for the package:

```

\eql@warning 72 \def\eql@error#1{\PackageError{eqnlines}{#1}{}}
```

```
73 \def\eql@warning{\PackageWarning{eqnlines}}
```

`\eql@error@nomathmode` Error messages concerning math mode:

```

\eql@error@mathmode 74 \def\eql@error@nomathmode#1{\eql@error{#1 allowed only in math mode}}
75 \def\eql@error@mathmode#1{\eql@error{#1 allowed only in paragraph mode}}
```

`\eql@warn@label@unused` Warning messages concerning unused and multiply declared labels and tags:

```

\eql@label@multiple 76 \def\eql@warn@label@unused{\eql@warning{Unused equation \string\label:}
77   label '\eql@nextlabel' will be lost}
\eql@tag@multiple 78 \def\eql@warn@label@multiple#1{\eql@warning{Multiple equation \string\label's:
79   previous label '#1' will be lost}}
80 \def\eql@tag@unused{\eql@warning{Unused equation \string\tag:
81   tag declaration will be lost}}
82 \def\eql@tag@multiple{\eql@warning{Multiple equation \string\tag's:
83   previous tag declaration will be lost}}
```

B.4 amsmath Integration

`\eql@amsmath@after` We need to overwrite certain macros from amsmath. The method `\eql@amsmath@after` executes argument #1 after loading amsmath is loaded. It also runs the code if amsmath `\eql@amsmath@undefine` has already been loaded. Furthermore, loading amsmath requires certain macros to be `\eql@amsmath@let` undefined. To this end `\eql@amsmath@before` will execute argument #1 before any future

loading of `amsmath`. `\eql@amsmath@undefine` undefines a macro in this way and `\eql@amsmath@let` overwrites a macro of `\ctanpkg{amsmath}`:

```
84 \def\eql@amsmath@after#1{\AddToHook{package/amsmath/after}{#1}}
85 \def\eql@amsmath@before#1{%
86   \@ifpackageloaded{amsmath}{}{\AddToHook{package/amsmath/before}{#1}}}
87 \def\eql@amsmath@undefine#1{\eql@amsmath@before{\let#1\undefined}}
88 \def\eql@amsmath@let#1#2{\eql@amsmath@undefine#1\let#1#2}
```

C Parameters and Registers

In the following, we collect parameter and register definitions.

C.1 Supporting Definitions

`\eql@false (bool)` Rather than the standard L^AT_EX scheme of `\xxxfalse`, `\xxxtrue` and `\ifxxx` for boolean variables `xxx`, we use a scheme where `\xxx` is either undefined or defined (to an empty macro) and is tested against by the ε-T_EX conditional `\ifdefined\xxx`. In order to make the scheme more tangible, we define the two expected values for boolean variables:

```
89 \let\eql@false\@undefined
90 \let\eql@true\@empty
```

`\eql@regunset@ (skip)` Some dimension registers need to be initialised to values which may depend on fonts and `\eql@regsetdelayed` styles, e.g. `1em`. As `\@mathmargin` of `amsmath`, we use the special value `-1sp` to indicate that this register should be initialised at the end of the preamble, and we define a skip register to hold this value. The macro `\eql@regsetdelayed` performs the delayed initialisation:

```
91 \newskip\eql@regunset@
92 \eql@regunset@-1sp\relax
93 \def\eql@regsetdelayed#1#2{%
94   #1\eql@regunset@\relax
95   \AtBeginDocument{%
96     \ifdim#1=\eql@regunset@
97       #1\glueexpr#2\relax
98     \fi
99   }%
100 }
```

C.2 Parameters

TODO: maybe sort parameters into sections **TODO:** or sort parameters in sections here

`\eql@tagsleft (bool)` The boolean parameter `\eql@tagsleft` specifies whether the tags are placed at the left or right margin:

```
101 \let\eql@tagsleft\eql@false
```

`\eql@flushleft (bool)` The boolean parameter `\eql@flushleft` specifies whether the layout is flush left or centered:

```
102 \let\eql@flushleft\eql@false
```

`\shleftmargin@ (dimen)` The default width of the left margin in flush-left mode is specified by `\eql@flushleftmargin@`. It may be pushed down to `\eql@flushleftmarginmin@` and up to `\eql@flushleftmarginmax@`:

```
103 \newdimen\eql@flushleftmargin@
104 \newdimen\eql@flushleftmarginmin@
105 \newdimen\eql@flushleftmarginmax@
106 \eql@regsetdelayed\eql@flushleftmargin@\leftmargini
107 \eql@flushleftmarginmin@\z@
108 \eql@flushleftmarginmax@.5\maxdimen
```

`\pl@tagmargin@ (dimen)` The intended margin width for tags in centered layout is specified by `\eql@tagmargin@`:

```
109 \newdimen\eql@tagmargin@
110 \eql@tagmargin@\z@
```

`\eql@indent@ (dimen)` The currently selected indentation width is specified by `\eql@indent@`. This dimension register is set to the macro `\eql@indent@val` when entering the equation environments:

```
111 \newdimen\eql@indent@
112 \def\eql@indent@val{2em}
```

`\paddingleft@ (dimen)` The padding of an equation (column) is specified by `\eql@paddingleft@` and

`\paddingright@ (dimen)` `\eql@paddingright@`. These dimension registers are set to the macros `\eql@paddingleft@val` and `\eql@paddingright@val`, respectively, when entering the equation environments:

```
113 \newdimen\eql@paddingleft@
114 \newdimen\eql@paddingright@
115 \def\eql@paddingleft@val{0pt}
116 \def\eql@paddingright@val{0pt}
```

`\eql@paddingmax (bool)` The boolean register `\eql@paddingmax` specifies whether the full line should be used for padding:

```
117 \let\eql@paddingmax\eql@false
```

`\eql@box@marginleft` The macros `\eql@box@marginleft` and `\eql@box@marginright` specify the margin surrounding equation boxes:

```
118 \def\eql@box@marginleft{\z@skip}
119 \def\eql@box@marginright{\z@skip}
```

`\eql@box@colsep` The macro `\eql@box@colsep` specifies the intercolumn separation for equation boxes:

```
120 \def\eql@box@colsep{2em}
```

`\eql@spread` The extra spread of equation lines is specified by `\eql@spread`:

```
121 \def\eql@spread{\jot}
122 \newdimen\eql@spread@amount@
```

`\eql@tagfuzz@ (dimen)` The value `\eql@tagfuzz@` specifies the margin of error for comparing whether a tag fits a given equation line. We should not expect rounding errors in the fixed point arithmetic of TeX, nevertheless: **TODO:** probably do not need this due to fixed point arithmetic.

```
123 \newdimen\eql@tagfuzz@
124 \eql@tagfuzz@16sp\relax
```

`\eql@display@height` An equation will appear to the surrounding text with a fixed apparent height and depth
`\eql@display@depth` specified by `\eql@display@height` and `\eql@display@depth`, respectively. By default it appears as a strut for equations:

```
125 \def\eql@display@height{\ht\eql@strutbox@}
126 \def\eql@display@depth{\dp\eql@strutbox@}
```

`\mode@short@ (counter)` The setting `\eql@skip@mode@short@` specifies when a reduced amount of glue should be used around equations in case the text line above the equation fits in the space that is left available in the first equation line. Value 0 turns this feature off, value 1 reduces the glue above the equation, value 2 furthermore reduces the glue below a single equation line and value 3 also reduces the glue below multi-line equations:

```
127 \newcount\eql@skip@mode@short@
128 \eql@skip@mode@short@\tw@

129 \newcount\eql@skip@mode@cont@
130 \eql@skip@mode@cont@\z@

131 \newcount\eql@skip@mode@par@
132 \eql@skip@mode@par@\z@

133 \newcount\eql@skip@mode@top@
134 \eql@skip@mode@top@\z@

135 \newcount\eql@skip@mode@leave@
136 \let\eql@skip@force@leave@\undefined
```

`eql@skip@force@above` 0: short, 1: long, 2: cont, 3: par, 4: top, 5: no, 6: med, 7: custom

`eql@skip@force@below`
`\mode@above@ (counter)` 137 \newcount\eql@skip@mode@above@
`\mode@below@ (counter)` 138 \newcount\eql@skip@mode@below@
139 \let\eql@skip@force@above@\undefined
140 \let\eql@skip@force@below@\undefined
141 \let\eql@skip@custom@above@\undefined
142 \let\eql@skip@custom@below@\undefined

`\eql@skip@cont@above` The glue when an equation is at the top of a horizontal list is specified by `\eql@skip@cont@above`:

`\eql@skip@top@above` The glue when an equation is at the top of a vertical list is specified by `\eql@skip@top@below` `\eql@skip@top@above` and `\eql@skip@top@below`:

`\eql@skip@par@above` The glue when an equation starts a paragraph is specified by `\eql@skip@par@above`:

`\eql@skip@med@above` The surrounding glue for an equation with reduced spacing is given by
`\eql@skip@med@below` `\eql@skip@med@above` and `\eql@skip@med@below`:

```
143 \def\eql@skip@long@above{\abovedisplayskip}
144 \def\eql@skip@long@below{\belowdisplayskip}
145 \def\eql@skip@short@above{\abovedisplayshortskip}
146 \def\eql@skip@short@below{\belowdisplayshortskip}
147 \def\eql@skip@cont@above{\eql@skip@short@above}
148 \def\eql@skip@cont@below{\eql@skip@short@below}
149 % \TODO: parabove plus parsip?
150 \def\eql@skip@par@above{\eql@skip@long@above}
151 \def\eql@skip@par@below{\eql@skip@long@below}
152 \def\eql@skip@top@above{\eql@skip@long@above}
```

```

153 \def\eql@skip@top@below{\eql@skip@long@below}
154 \def\eql@skip@med@above{\abovedisplayskip/2}
155 \def\eql@skip@med@below{\belowdisplayskip/2}
156 \def\eql@skip@tag@above{\z@skip}
157 \def\eql@skip@tag@below{\z@skip}
158 \def\eql@skip@partag@above{\z@skip}
159 \def\eql@skip@partag@below{\z@skip}
160 \def\eql@skip@medtag@above{\z@skip}
161 \def\eql@skip@medtag@below{\z@skip}

```

\eql@colsepmin@ (*dimen*) The minimum and maximum intercolumn separation is specified by \eql@colsepmin@ and \eql@colsepmax@. These dimension registers are set to the macros \eql@colsepmin@val \eql@colsepmin@val and \eql@colsepmax@val, respectively, when entering the equation \eql@colsepmax@val environments to allow font-dependent values including `calc` evaluations:

```

162 \newdimen\eql@colsepmin@
163 \newdimen\eql@colsepmax@
164 \def\eql@colsepmin@val{1em}
165 \def\eql@colsepmax@val{.5\maxdimen}

```

\eql@tagwidthmin@ (*dimen*) The minimum tag width is specified by \eql@tagwidthmin@:

```

166 \newdimen\eql@tagwidthmin@
167 \eql@tagwidthmin@\z@

```

\eql@tagsepmin@ (*dimen*) The minimum separation between an equation and its tag is given by \eql@tagsepmin@. TeX's built-in value is half a quad in font number 2 (.5\fontdimen6\textfont\tw@). As the tag is processed in text mode, we use 0.5em instead. **TODO:** may set within environment

```

168 \newdimen\eql@tagsepmin@
169 \eql@regsetdelayed\eql@tagsepmin@{.5em}

```

C.3 Registers

\eql@row@ (*counter*) \eql@row@ counts the present row (1-based) and \eql@totalrows@ holds the total number @totalrows@ (*counter*) of rows:

```

170 \newcount\eql@row@
171 \newcount\eql@totalrows@

```

\eql@colsep@ (*dimen*) The dimension of the intercolumn separation for align environments is stored in \eql@colsep@:

```

172 \newdimen\eql@colsep@

```

\eql@firstavail@ (*dimen*) The unused space on the first line of an alignment is stored in \eql@display@firstavail@ for comparison against \predisplaysize and determining short skip mode of display equations. It it convenient to set it via \eql@display@firstavail@set provided that we are on the first line:

```

173 \newdimen\eql@display@firstavail@
174 \def\eql@display@firstavail@set#1{%
175   \ifnum\eql@row@=\@ne
176     \global\eql@display@firstavail@#1%
177   \fi
178 }

```

`\firstlast@ (counter)` The counter stores whether the tag one first/last line is raised/lowered as 1/2 (or 3 for both). This implies a different vskip corresponding to the mostly empty line:

```
179 \newcount\eql@raisetag@firstlast@
```

`\eql@fieldbox@ (box)` The box `\eql@fieldbox@` holds the present alignment component and `\eql@tagbox@` the tag for the present line. The corresponding dimensions `\eql@fieldwidth@` and `\eql@tagwidth@ (dimen)` hold their widths:

```
180 \newbox\eql@fieldbox@  
181 \newbox\eql@tagbox@  
182 \newdimen\eql@fieldwidth@  
183 \newdimen\eql@tagwidth@
```

`\line@height@ (dimen)` The dimension registers `\eql@line@height@` and `\eql@line@depth@` keep track of the height and depth of the present line in an alignment:

```
184 \newdimen\eql@line@height@  
185 \newdimen\eql@line@depth@
```

`\ifmeasuring@ (bool)` All display environments get typeset twice – once during a “measuring” phase and then again during a “production” phase. We reuse the original `amsmath` definition `\ifmeasuring@` to determine which case we’re in, so we and other packages may take appropriate action. It does not hurt to define this conditional in any case. We should tell `hyperref` about measuring processes as we’re not `amsmath` and not being catered for:

```
186 % \newif\ifmeasuring@  
187 \ifdefined\measuring@true\else  
188   \expandafter\newif\csname ifmeasuring@\endcsname  
189 \fi  
190 \AddToHook{package/hyperref/after}{  
191   \ifdefined\Hy@ifnotmeasuring  
192     \renewcommand\Hy@ifnotmeasuring[1]{\ifmeasuring@\else#1\fi}  
193   \fi  
194 }
```

`\if@display (bool)` `amsmath` defines the conditional `\if@display` to test whether we’re in a display equation including the inner math parts of equation blocks. We provide it in case `amsmath` is absent, and initialise it:

```
195 % \newif\if@display  
196 \ifdefined\@displaytrue\else  
197   \expandafter\newif\csname if@display\endcsname  
198   \everydisplay\expandafter{\the\everydisplay\@displaytrue}  
199 \fi
```

C.4 Hooks

`\eql@hook@...` For what it’s worth, we define a couple of entry points where one might hook into the equations typesetting framework. The L^AT_EX hook framework would be more versatile, but as the purpose of these hooks is rather unclear at the moment, we make this as efficient as it could get: **TODO:** may add a few more hooks

```
200 \let\eql@hook@blockbefore\empty  
201 \let\eql@hook@blockafter\empty  
202 \let\eql@hook@blockin\empty
```

```

203 \let\eql@hook@blockout\empty
204 \let\eql@hook@linein\empty
205 \Let\eql@hook@lineout\empty
206 \let\eql@hook@colin\empty

274 \fi

```

E Punctuation

The equations environments supply an automatic punctuation scheme which allows to define a default punctuation at the end of each column, line and equation block.

`\eql@punct@col` These macros store the punctuation character for columns, lines and blocks. A value `\relax` indicates that the punctuation should be handed down to the next lower level:
`\eql@punct@line`
`\eql@punct@block`

```

275 \let\eql@punct@col\empty
276 \let\eql@punct@line\relax
277 \let\eql@punct@block\relax

```

`\eql@punct@sep` This macro stores the separation to be applied before the punctuation (unless it is empty):

```
278 \let\eql@punct@sep\relax
```

`\eqnpunctcol` Set the punctuation for columns, lines and blocks. Note that the macro `\eqnpunct` sets the punctuation for the next equation block (only). Starred versions clear the punctuation for the respectively levels:

`\eqnpunct`

```

279 \def\eqnpunctcol{\eql@ifstar@tight\eql@punct@col@setrelax\eql@punct@col@set}
280 \def\eql@punct@col@set#1{\def\eql@punct@col{#1}\ignorespaces}
281 \def\eql@punct@col@setrelax{\let\eql@punct@col\empty\ignorespaces}
282 \def\eqnpunctline{\eql@ifstar@tight\eql@punct@line@setrelax\eql@punct@line@set}
283 \def\eql@punct@line@set#1{\def\eql@punct@line{#1}\ignorespaces}
284 \def\eql@punct@line@setrelax{\let\eql@punct@line\relax\ignorespaces}
285 \def\eqnpunctmain{\eql@ifstar@tight\eql@punct@main@setrelax\eql@punct@main@set}
286 \def\eql@punct@main@set#1{\eqnlineset{punct={#1}}\ignorespaces}
287 \def\eql@punct@main@setrelax{\eqnlineset{punct*}\ignorespaces}
288 \def\eqnpunct{\eql@ifstar@tight\eql@punct@next@setrelax\eql@punct@next@set}
289 \def\eql@punct@next@set#1{\eqnaddopt{punct={#1}}\ignorespaces}
290 \def\eql@punct@next@setrelax{\eqnaddopt{punct*}\ignorespaces}

```

`\eql@punct@apply@col` Output the punctuation for the present column. If non-empty, prepend some separation. Clear the punctuation so that no further column punctuation is output within the current group:

```
291 \def\eql@punct@apply@col{%
```

```

292  \ifx\eql@punct@col\@empty\else
293    \eql@punct@sep
294    \eql@punct@col
295    \let\eql@punct@col\@empty
296  \fi
297 }

```

Output the punctuation currently set for lines unless disabled. Alike `\eql@punct@apply@col` prevent further output of punctuations for lines and columns within the current group:

`eql@punct@apply@line`

```

298 \def\eql@punct@apply@line{%
299   \ifx\eql@punct@line\relax
300 % \TODO hand down immediately?
301   \else
302     \ifx\eql@punct@line\@empty\else
303       \eql@punct@sep
304       \eql@punct@line
305     \fi
306     \let\eql@punct@line\relax
307     \let\eql@punct@col\@empty
308   \fi
309 }

```

`ql@punct@apply@block` Outputs the punctuation for the current equation block unless disabled in analogy to `\eql@punct@apply@line`:

```

310 \def\eql@punct@apply@block{%
311   \ifx\eql@punct@block\relax
312 % \TODO hand down immediately?
313   \else
314     \ifx\eql@punct@block\@empty\else
315       \eql@punct@sep
316       \eql@punct@block
317     \fi
318     \let\eql@punct@block\relax
319     \let\eql@punct@line\relax
320     \let\eql@punct@col\@empty
321   \fi
322 }

```

F Math Classes at Alignment

The following describes the adjustment of math classes surrounding the alignment marker.

`lass@innerright@sel@` Select between `\eql@class@innerlead` and `\eql@class@innerright` depending on whether the left part of the aligned column is empty:

```

323 \def\eql@class@innerright@sel@{%
324   \ifdim\eql@fieldwidth@=\z@
325     \eql@class@innerlead
326   \else
327     \eql@class@innerright
328   \fi
329 }

```

`@class@innerleft@set` Set the left, right and leading math classes. Setting the right math class disables the `class@innerright@set` leading math class, so the leading math class must be specified after the right one:

```

0class@innerlead@set
330 \def\eql@class@innerleft@set#1{%
331   \def\eql@class@innerleft{#1}%
332 }
333 \def\eql@class@innerright@set#1{%
334   \def\eql@class@innerright{#1}%
335   \let\eql@class@innerright@sel\eql@class@innerright
336 }
337 \def\eql@class@innerlead@set#1{%
338   \def\eql@class@innerlead{#1}%
339   \let\eql@class@innerright@sel\eql@class@innerright@sel%
340 }
```

`\eql@class@ampeq` We define two standard combinations of math classes intended to be used with ‘&=’ `\eql@class@eqamp` (`ampeq`) or ‘=&’ (`eqamp`). The default setting is ‘&=’ (`ampeq`):

```

341 \def\eql@class@ampeq{%
342   \eql@class@innerleft@set{}%
343   \eql@class@innerright@set{}%
344 }
345 \def\eql@class@eqamp{%
346   \eql@class@innerleft@set{\mathrel{}}%
347   \eql@class@innerright@set{\mathrel{}}%
348   \eql@class@innerlead@set{}%
349 }
350 \eql@class@ampeq
```

G Equations Box Environment

I Subequation Numbering

We replicate the `amsmath` functionality to number a block of equations with a common number and a sub-numbering.

I.1 Definitions

`\parentequation (counter)` We define a counter to store the main equation number while in subequation mode. It makes sense to share this definition with `amsmath` as `\parentequation`, and we need to undefine it when `amsmath` is loaded at a later stage:

```
1103 \eql@amsmath@undefine\c@parentequation
1104 \eql@amsmath@undefine\theparentequation
1105 \ifdefined\c@parentequation\else
1106 \newcounter{parentequation}
1107 \fi
```

`\subequations@template` We store a template which will be installed as `\theequation` in subequations mode: **TODO:** need to protect something?!

```
1108 \def\eql@subequations@template{\theparentequation\alph{equation}}
```

`\subequations@active` A boolean register which tells whether subequations are in use and thus must not be invoked again:

```
1109 \let\eql@subequations@active\eql@false
```

`\eql@subequations@init` Low-level initialise the subequations mode. Store the equation counter in `\eql@subequations@restorecounter` for the case that no equation numbers will be used. Step the equation counter, copy it to `\parentequation` and initialise `\theparentequation` (and its `hyperref` counterpart) with the expanded current value of `\theequation`; fill with tag data instead if a tag has been specified. Reset the equation counter and use the template for `\theequation`:

```
1110 \def\eql@subequations@init{%
1111   \edef\eql@subequations@restorecounter{%
1112     \global\c@equation\the\c@equation\relax}%
1113   \ifdefined\eql@blocktag
1114     \expandafter\eql@tag@makenext\eql@blocktag
1115     \eql@nexttag
1116     \eql@numbering@refstep
1117     \protected@edef\theHparentequation{\eql@numbering@ref}%
1118     \protected@edef\theparentequation{\eql@tag@text}%
1119   \else
1120     \advance\c@equation\@ne
1121     \protected@edef\theparentequation{\theequation}%
1122     \ifdefined\theHequation
1123       \protected@edef\theHparentequation{\theHequation}%
1124     \fi
1125   \fi
1126   \global\c@parentequation\c@equation
1127   \global\c@equation\z@
1128   \let\theequation\eql@subequations@template
1129   \def\theHequation{\theHparentequation.\arabic{equation}}%
1130 }
```

`l@subequations@close` Low-level close the subequations mode. If no number has been used, return to the original equation counter, otherwise use the value stored in `parentequation`. Note that we cannot use `\setcounter` here because the calc version would involve actions which are not allowed after `\halign` within a display equation:

```
1131 \def\eql@subequations@close{%
1132   \ifnum\c@equation=\z@
1133     \eql@subequations@restorecounter
1134   \else
1135     \global\c@equation\c@parentequation
1136   \fi
1137 }
```

I.2 Environment

`l@subequations@start` Start the subequations environment with optional parameters in #1. Enter subequations mode and set an anchor for subsequent `\label`'s. Manually print the `showkeys` tag:

TODO: join with other similar anchor routines `\eql@numbering@printsubeqlabel`

```
1138 \def\eql@subequations@start{%
1139   \let\eql@blocktag\@undefined
1140   \let\eql@blocklabel\@undefined
1141   \eql@nextopt@process{subequations}%
1142   \eql@subequations@init
1143   \eql@numbering@refstep
1144   \edef\eql@subequations@currentHref{\eql@numbering@ref}%
1145   \eql@Hy@anchor\eql@subequations@currentHref
1146   \edef\eql@subequations@thepage{\thepage}%
1147   \def\@currentcounter{equation}%
1148   \let\@currentHref\eql@subequations@currentHref
1149   \protected@edef\@currentlabel{\p@equation\theparentequation}%
1150   \let\@currentlabelname\eql@labelname@default
1151   \let\eql@subequations@active\eql@true
1152   \ifdef\eql@blocklabel
1153     \eql@SK@label\eql@blocklabel
1154   \fi
1155   \ignorespaces
1156 }
```

`eql@subequations@end` End the subequations environment. Issue the label if one has been specified and an equation number has actually been used. Then close subequations mode:

```
1157 \def\eql@subequations@end{%
1158   \ifnum\c@equation>\z@
1159     \ifdef\eql@blocklabel
1160       \begingroup
1161         \def\@currentcounter{equation}%
1162         \let\thepage\eql@subequations@thepage
1163         \let\@currentHref\eql@subequations@currentHref
1164 % \TODO how about tag* ?! also within equations!
1165         \protected@edef\@currentlabel{\p@equation\theparentequation}%
1166         \let\@currentlabelname\eql@labelname@default
1167         \expandafter\eql@label@clean\expandafter{\eql@blocklabel}%
1168       \endgroup
1169     \fi
1170   \fi
1171   \eql@subequations@close
1172   \ignorespacesafterend
```

```
1173 }
```

`subequations (env.)` The subequations environment tests for optional parameters and passes on to the start and end routines:

```
1174 \newenvironment{eql@subequations}{%
1175 <dev>\eql@dev@enterenv
1176   \eql@subequations@testall\eql@subequations@start%
1177 }{%
1178   \eql@subequations@end
1179 <dev>\eql@dev@leaveenv
1180 }
```

TODO: describe

K Horizontal Spacing for Lines

The following code adjusts individual lines of equations for the equation and lines mode according to the selected layout and shape.

K.1 Supporting Definitionss

\inf@bad The \inf@bad constant is for testing overfull boxes:

```

1580 \ifdefined\inf@bad\else%
1581   \newcount\inf@bad
1582   \inf@bad1000000\relax
1583 \fi

```

\eql@restore@hfuzz We need to change the value of \hfuzz temporarily. The method \eql@save@hfuzz stores \eql@save@hfuzz

the value for recovery through `\eql@restore@hfuzz`:

```
1584 \let\eql@restore@hfuzz\empty  
1585 \def\eql@save@hfuzz{\edef\eql@restore@hfuzz{\hfuzz\the\hfuzz\relax}}
```

`\eql@shape@pos@ (dimen)` The registers `\eql@shape@pos@` and `\eql@shape@amount@` specify the currently selected horizontal alignment (0 for left, 1 for center, 2 for right) and the indentation amount, respectively:

```
1586 \newcount\eql@shape@pos@  
1587 \newdimen\eql@shape@amount@
```

`\eql@marginleft@ (dimen)` The registers `\eql@marginleft@` and `\eql@marginright@` store the intended left and right margin for the equation lines:

```
1588 \newdimen\eql@marginleft@  
1589 \newdimen\eql@marginright@
```

`\eql@marginbadness@` The registers `\eql@marginbadness@` and `\eql@maxbadness@` store the allowable badness threshold for shrinking equation lines to the intended margin or to fit into the line at all before the tag is raised or lowered:

```
1590 \newcount\eql@marginbadness@  
1591 \newcount\eql@maxbadness@  
1592 \eql@marginbadness@\inf@bad  
1593 \eql@maxbadness@\inf@bad
```

K.2 Shape Schemes

The horizontal alignment of each line is specified by a shape scheme.

`\eql@shape@tab@...` We select the scheme through a `\csname` selector with the following names:

```
1594 \def\eql@shape@tab@default{default}  
1595 \def\eql@shape@tab@left{left}  
1596 \def\eql@shape@tab@center{center}  
1597 \def\eql@shape@tab@right{right}  
1598 \def\eql@shape@tab@first{first}  
1599 \def\eql@shape@tab@hanging{hanging}  
1600 \def\eql@shape@tab@steps{steps}
```

For convenience, we add further alias names for the schemes:

```
1601 \let\eql@shape@tab@def\eql@shape@tab@default  
1602 \let\eql@shape@tab@\eql@shape@tab@default  
1603 \let\eql@shape@tab@l\eql@shape@tab@left  
1604 \let\eql@shape@tab@c\eql@shape@tab@center  
1605 \let\eql@shape@tab@r\eql@shape@tab@right  
1606 \let\eql@shape@tab@rc\eql@shape@tab@first  
1607 \let\eql@shape@tab@indent\eql@shape@tab@first  
1608 \let\eql@shape@tab@hang\eql@shape@tab@hanging  
1609 \let\eql@shape@tab@cl\eql@shape@tab@hanging  
1610 \let\eql@shape@tab@outdent\eql@shape@tab@hanging  
1611 \let\eql@shape@tab@lcr\eql@shape@tab@steps
```

`\eql@shape@mode` The currently selected scheme is stored in `\eql@shape@mode`. It is set to `default`:

```
1612 \let\eql@shape@mode\eql@shape@tab@default
```

\eql@shape@set Set the scheme via the translation table:

```
1613 \def\eql@shape@set#1{%
1614   \ifcsname eql@shape@tab@#1\endcsname
1615     \expandafter\let\expandafter\eql@shape@mode
1616       \csname eql@shape@tab@#1\endcsname
1617   \else
1618     \eql@error{shape '#1' unknown: setting to default}%
1619     \let\eql@shape@mode\eql@shape@tab@default
1620   \fi
1621 }
```

\eql@shape@center@... Define the uniform shape schemes `left`, `center`, `right` and `default` for the centered and flush-left layout. The scheme functions determine the desired alignment and indentation for the current row:

```
1622 \def\eql@shape@center@left{\eql@shape@pos@z@eql@shape@amount@z@}
1623 \def\eql@shape@center@center{\eql@shape@pos@one\eql@shape@amount@z@}
1624 \def\eql@shape@center@right{\eql@shape@pos@tw@eql@shape@amount@z@}
1625 \let\eql@shape@center@default\eql@shape@center@center
1626 \def\eql@shape@left@left{\eql@shape@pos@z@eql@shape@amount@z@}
1627 \def\eql@shape@left@center{\eql@shape@pos@one\eql@shape@amount@z@}
1628 \def\eql@shape@left@right{\eql@shape@pos@tw@eql@shape@amount@z@}
1629 \let\eql@shape@left@default\eql@shape@left@left
```

The `first` scheme implements left alignment with indentation for the first line (unless there is only one line):

```
1630 \def\eql@shape@center@first{%
1631   \eql@shape@pos@z@
1632   \eql@shape@amount@z@
1633   \ifnum\eql@totalrows@>one
1634     \ifnum\eql@row@=one
1635       \eql@shape@amount@\eql@indent@
1636     \fi
1637   \fi
1638 }
1639 \def\eql@shape@left@first{%
1640   \eql@shape@pos@z@
1641   \eql@shape@amount@z@
1642   \ifnum\eql@totalrows@>one
1643     \ifnum\eql@row@=one
1644       \eql@shape@amount@\eql@indent@
1645     \fi
1646   \fi
1647 }
```

The `hanging` scheme implements left alignment with hanging indentation for the first line (unless there is only one line). In centered layout all but the first line are indented while in flush-left layout the first line has negative indentation:

```
1648 \def\eql@shape@center@hanging{%
1649   \eql@shape@pos@z@
1650   \eql@shape@amount@\eql@indent@
1651   \ifnum\eql@totalrows@>one
1652     \ifnum\eql@row@=one
1653       \eql@shape@amount@z@
1654     \fi
1655   \fi
1656 }
```

```

1657 \def\eql@shape@left@changing{%
1658   \eql@shape@pos@z@
1659   \eql@shape@amount@z@
1660   \ifnum\eql@totalrows@>\@ne
1661     \ifnum\eql@row@=\@ne
1662       \eql@shape@amount@-\eql@indent@
1663     \fi
1664   \fi
1665 }

```

The `steps` scheme implements singles out the first and last lines which are shifted left and right, respectively. In centered layout the shift operates on the alignment whereas in flush-left layout the shift uses indentation:

```

1666 \def\eql@shape@center@steps{%
1667   \eql@shape@amount@z@
1668   \eql@shape@pos@z@
1669   \ifnum\eql@totalrows@>\@ne
1670     \ifnum\eql@row@=\@ne
1671       \eql@shape@pos@z@
1672     \fi
1673     \ifnum\eql@row@=\eql@totalrows@
1674       \eql@shape@pos@tw@
1675     \fi
1676   \fi
1677 }
1678 \def\eql@shape@left@steps{%
1679   \eql@shape@pos@z@
1680   \eql@shape@amount@z@
1681   \ifnum\eql@totalrows@>\@ne
1682     \ifnum\eql@row@=\@ne
1683       \eql@shape@amount@-\eql@indent@
1684     \fi
1685     \ifnum\eql@row@=\eql@totalrows@
1686       \eql@shape@amount@\eql@indent@
1687     \fi
1688   \fi
1689 }

```

`\eql@shape@sel` Select the shape selector function for the currrent scheme @`\eql@shape@mode` and layout `\eql@shape@eval` and store it in `\eql@shape@eval`:

```

1690 \let\eql@shape@eval\@undefined
1691 \def\eql@shape@sel{%
1692   \expandafter\let\expandafter\eql@shape@eval
1693   \csname eql@shape%
1694   @\ifdefined\eql@flushleft left\else center\fi
1695   @\eql@shape@mode\endcsname
1696 }

```

`eql@adjust@shoveleft` Adjust the alignment of the current equation line. For left alignment an optional argument `ql@adjust@shoveright` specifies the amount of indentation:

```

1697 \def\eql@adjust@shoveleft{%
1698   \global\eql@shape@pos@z@
1699   \eql@srbgroup\eql@ifstar@tight
1700   {\eql@adjust@shoveleft@[\eql@indent@]}%
1701   {\eql@ifnextgobble@tight{!}}%
1702   {\eql@adjust@shoveleft@[-\eql@indent@]}%

```

```

```

K.3 Adjustment Methods

`\eql@adjust@try` Try to fit the current equation line in the available space. Argument #1 specifies the amount of reserved space. Unpack the box `\eql@fieldbox@`, replace the previous kerning with the new reserved space, and save the box back into `\eql@fieldbox@`:

```

1712 \def\eql@adjust@try#1{%
1713   \setbox\eql@fieldbox@\hbox to\displaywidth{%
1714     \unhbox\eql@fieldbox@\unkern\kern#1}%
1715 }

```

`\eql@adjust@print` We have found the final adjustment of the current line, so we typeset it with initial and final space adjustments #1 and #2, respectively. Restore the original value for `\hfuzz`:

```

1716 \def\eql@adjust@print#1#2{%
1717   \eql@restore@hfuzz
1718   \hbox to\displaywidth{%
1719     #1%
1720     \unhbox\eql@fieldbox@\unkern
1721     #2%
1722     \eql@tagging@mathaddlast
1723   }%
1724 }

```

`just@print@alignleft` Fit the current equation line with the selected alignment within a given left and right margin #1 and #2. If we're on the first line, adjust `\eql@display@firstavail@` to the minimum left available space we can guarantee:

```

1725 \def\eql@adjust@print@alignleft#1#2{%
1726   \ifnum\eql@row@=\@ne
1727     \global\eql@display@firstavail@#1%
1728   \fi
1729   \eql@adjust@print{\kern#1}{\kern#2}%
1730 }
1731 \def\eql@adjust@print@alignright#1#2{%
1732   \ifnum\eql@row@=\@ne
1733     \eql@display@firstavail@\displaywidth
1734     \advance\eql@display@firstavail@-\eql@fieldwidth@
1735     \global\advance\eql@display@firstavail@-#2%
1736   \fi
1737   \eql@adjust@print{\kern#1\hfil}{\unskip\kern#2}%
1738 }
1739 \def\eql@adjust@print@aligncenter#1#2{%
1740   \ifnum\eql@row@=\@ne
1741     \eql@display@firstavail@\displaywidth
1742     \advance\eql@display@firstavail@-\eql@fieldwidth@
1743     \advance\eql@display@firstavail@#1%
1744     \advance\eql@display@firstavail@-#2%

```

```

1745     \global\divide\eql@display@firstavail@\tw@
1746     \fi
1747     \eql@adjust@print{\kern#1\hfil}{\kern#2}%
1748 }

```

`\eql@adjust@init` Initialise the horizontal adjustment framework. Turn off overfull box messages temporarily – otherwise there would be unwanted extra ones emitted during our measuring operations. Select the shape scheme:

```

1749 \def\eql@adjust@init{%
1750   \eql@save@hfuzz
1751   \hfuzz\maxdimen
1752   \eql@shape@sel
1753 }

```

`\eql@adjust@sel@tag` Select the appropriate adjustment method depending on the selected layout, selected tag `eql@adjust@sel@notag` placement, current alignment position and on whether a tag is present or not:

```

1754 \def\eql@adjust@sel@tag{%
1755   \eql@tagging@tagaddbox
1756   \ifcase\eql@shape@pos@
1757     \eql@tagging@alignleft
1758   \or
1759     \eql@tagging@aligncenter
1760   \or
1761     \eql@tagging@alignright
1762   \fi
1763   \csname eql@adjust%
1764     @\ifdefined\eql@flushleft flushleft\else center\fi
1765     @\ifdefined\eql@tagsleft tagsleft\else tagsright\fi
1766     @\ifcase\eql@shape@pos@ shoveleft\or shovcenter\or shoveright\fi
1767   @tag\endcsname
1768 }
1769 \def\eql@adjust@sel@notag{%
1770   \eql@tagging@tagaddbox
1771   \ifcase\eql@shape@pos@
1772     \eql@tagging@alignleft
1773   \or
1774     \eql@tagging@aligncenter
1775   \or
1776     \eql@tagging@alignright
1777   \fi
1778   \csname eql@adjust%
1779     @\ifdefined\eql@flushleft flushleft\else center\fi
1780     @\ifdefined\eql@tagsleft tagsleft\else tagsright\fi
1781     @\ifcase\eql@shape@pos@ shoveleft\or shovcenter\or shoveright\fi
1782   @notag\endcsname
1783 }

```

P Interface

P.1 Scanning the Environment's Body

The multi-line equatiuon environment must scan its body twice: once to determine how wide the columns are and then to actually typeset them. This means that we must collect all text in this body before calling the environment macros. The mechanism and its description follows `amsmath` closely.

`\eql@scan@reg@` We start by defining a token register to contain the body.

```
3278 \newtoks\eql@scan@reg@
```

TODO: describe

```

3279 \def\eql@scan@body@dump{\the\eql@scan@reg@}
3280 \def\eql@scan@body@rescan{%
3281   \expandafter\scantokens\expandafter{\the\eql@scan@reg@}}
3282 \let\eql@scan@body\eql@scan@body@dump

```

`\eql@scan@addto` Then we define a macro to add something (i.e. its argument) to the token register `\@envbody`:

```
3283 \def\eql@scan@addto#1{\eql@scan@reg@\expandafter{\the\eql@scan@reg@#1}}
```

`\eql@scan@env` The macro `\eql@scan@env` starts the scan for the `\end{...}` command of the current environment. It takes a macro name as argument. This macro is supposed to take the whole body of the environment as its argument:

```

3284 \def\eql@scan@env#1{%
3285 <dev>\eql@dev@enter\eql@scan@env
3286   \def\eql@scan@end{\#1\expandafter\end\expandafter{\@currenvir}}%
3287   \eql@scan@reg@{}\def\eql@scan@stack{b}%

```

If we simply called `\eql@scan@env@iterate` directly, the error message for a `\par` token (usually from a blank line) would refer to `\eql@scan@env@iterate` which would not be illuminating. We use a little finesse to get a more intelligible error message: We use the actual environment name as the name of the temporary function that is `\let` to `\eql@scan@env@iterate`:

```

3288 \edef\eql@scan@iterate{\expandafter\noexpand\csname@currenvir\endcsname}%
3289 \expandafter\let\expandafter\eql@scan@env@org\eql@scan@iterate
3290 \expandafter\let\eql@scan@iterate\eql@scan@env@iterate
3291 \eql@scan@iterate
3292 }

```

\eql@scan@env@count When adding a piece of the current environment's contents to \eql@scan@reg@, we scan it to check for additional \begin tokens, and add a 'b' to the stack for any that we find.

```

3293 \def\eql@scan@env@count#1\begin#2{%
3294   \ifx\end#2\else b\expandafter\eql@scan@env@count\fi
3295 }

```

\eql@scan@env@iterate \eql@scan@env@iterate takes two arguments: the first will consist of all text up to the next \end command, the second will be the \end command's argument. If there are any extra \begin commands in the body text, a marker is pushed onto a stack by the \push@begins function. Empty state for this stack means that we have reached the \end that matches our original \begin. Otherwise we need to include the \end and its argument in the material that we are adding to our environment body accumulator:

```

3296 \def\eql@scan@env@iterate#1\end#2{%
3297   \edef\eql@scan@stack{%
3298     \eql@scan@env@count#1\begin\end\expandafter@gobble\eql@scan@stack}%
3299   \ifx\@empty\eql@scan@stack
3300     \@checkend{#2}%
3301     \eql@scan@addto{#1}%
3302     \expandafter\let\eql@scan@iterate\eql@scan@env@org
3303 <dev>\eql@dev@leave\eql@scan@env
3304   \expandafter\eql@scan@end
3305   \else
3306     \eql@scan@addto{#1\end{#2}}%
3307     \expandafter\eql@scan@iterate
3308   \fi
3309 }

```

P.4 Independent Routines of amsmath

\eqref amsmath defines the macro \eqref to refer to equation labels in a proper format We provide it for completeness: **TODO:** versions of eqref for ranges (optional argument) or lists (.)?

```
3477 \DeclareRobustCommand{\eql@eqref}[1]{\textup{\eql@tag@boxedform{\ref{#1}}}}
```

\numberwithin amsmath defines the macro \numberwithin to specify that equations should be numbered within sections. The L^AT_EX kernel contains a similar command \counterwithin (with a slightly extended syntax) that can be used as a drop-in replacement for \numberwithin:

```

3478 \DeclareRobustCommand{\eql@numberwithin}[3]{\arabic{#1}%
3479   \ifundefined{c@#2}{\nocounterr{#2}}{%
3480     \ifundefined{c@#3}{\nocounterr{#3}}{%
3481       \ifdefined\HyOrg@addtoreset
3482         \HyOrg@addtoreset{#2}{#3}%
3483       \else
3484         \caddtoreset{#2}{#3}%
3485       \fi
3486       \expandafter\xdef\csname the#2\endcsname{%
3487         \expandafter\noexpand\csname the#3\endcsname.\noexpand#1{#2}}%
3488       \ifdefined\theHequation
3489         \expandafter\xdef\csname theH#2\endcsname{%
3490           \expandafter\noexpand
3491             \csname the\ifundefined{theH#3}{}H#3\endcsname.%%
3492               \noexpand\arabic{#2}}%
3493       \fi
3494     }%
3495   }%
3496 }

```

\allowdisplaybreaks amsmath defines the macro \allowdisplaybreaks which we also provide for completeness. The package uses the general setup mechanism instead:

```

3497 \DeclareRobustCommand{\eql@allowdisplaybreaks}[1][4]{%
3498   \eqnlineset{allowbreaks=#1}%
3499 }

```

\notag amsmath defines the alias \notag for \nonumber which we also provide for completeness:

```
3500 \newcommand{\eql@notag}{\nonumber}
```

\thetag amsmath defines \thetag to print a tag which we also provide for completeness:

```
3501 \newcommand{\eql@thetag}{\leavevmode\eql@tag@boxedform}
```

Q Options

The package uses the keyval mechanism to parse key-value pairs to specify adjustments to the behaviour of the equations environments:

```
3502 \RequirePackage{keyval}
```

Q.1 Selection Tools

\eql@decide@select Some parameter values take values in a given set, e.g. `true` vs. `false` or `left` vs. `right`. The macro `\eql@decide@select` is a general purpose selector. Arguments #1 and #2 describe the category and key which are used only towards error messages. Argument #3 contains the value and argument #4 is a list of values and corresponding actions in the format

```
{ {{val1a, val1b, ... }{act1}, {{val2a, val2b, ... }{act2}, ... }.
```

If no corresponding value is found in the list, an error message is invoked. Single expansion is applied to the list of values:

```
3503 \def\eql@decide@select#1#2#3#4{%
3504   \def\@tempa{#3}%
3505   \let\@tempd\@undefined
3506   \@for\@tempc:=#4\do{%
3507     \ifdefined\@tempd\else
3508       \edef\@tempb{\noexpand\@tempb:=\expandafter\@firstoftwo\@tempc}%
3509       \expandafter\@for\@tempb\do{%
3510         \ifx\@tempa\@tempb
3511           \expandafter\expandafter\expandafter\def
3512           \expandafter\expandafter\expandafter\expandafter\@tempd
3513           \expandafter\expandafter\expandafter\expandafter{%
3514             \expandafter\expandafter\expandafter\expandafter\@secondoftwo\@tempc}%
3515         \fi
3516       }%
3517     \fi
3518   }%
3519   \ifdefined\@tempd
3520     \@tempd
3521   \else
3522     \eql@error{undefined value '#3' for option '#2' of '#1'}%
3523   \fi
3524 }
```

\eql@decide@if We will often have to decide between `true` and `false` or related pairs of values:

```
3525 \def\eql@decide@if#1#2#3#4#5{%
3526   \eql@decide@select{#1}{#2}{#3}{%
3527     {{on,true,yes(enabled,1){#4}},%
3528      {{off,false,no(disabled,0){#5}}}}}
```

\eql@decide@bool Boolean values frequently need to be stored into conditional registers:

```
3529 \def\eql@decide@bool#1#2#3#4{%
3530   \eql@decide@if{#1}{#2}{#3}{\let#4\eql@true}{\let#4\eql@false}}
```

ql@decide@abovebelow **TODO:** describe

```
3531 \def\eql@decide@abovebelow#1#2#3#4#5{%
3532   \eql@decide@select{#1}{#2}{#3}{%
3533     {,abovebelow,both,tb}{#4#5},%
3534     {above,top,t}{#4},%
3535     {below,bottom,b}{#5}}%
3536 }
```

Q.2 Declaration Code

\eql@define@key For convenience, we define a wrapper for keyval's \define@key which accepts lists of categories and keys. We prepend the prefix eql@ to all our categories so that it is hidden from the user in error messages:

```

3537 \def\eql@define@key#1#2{%
3538   \eql@ifnextchar@loose[%]
3539   {\eql@definekey@opt{#1}{#2}}%
3540   {\eql@definekey@noopt{#1}{#2}}%
3541 }%
3542 \def\eql@definekey@noopt#1#2#3{\eql@definekey@for{#1}{#2}{#3}}%
3543 \def\eql@definekey@opt#1#2[#3]{\eql@definekey@for{#1}{#2}{[#3]{#4}}}%
3544 \def\eql@definekey@for#1#2#3{%
3545   \def\eql@for@fn##1##2##3{\define@key{eql@##3}{##2##3}}%
3546   \edef\eql@for@vara{\noexpand\eql@for@vara:=#1}%
3547   \expandafter\for\eql@for@vara\do{%
3548     \edef\eql@for@varb{\noexpand\eql@for@varb:=#2}%
3549     \expandafter\for\eql@for@varb\do{%
3550       \edef\eql@for@call##1{%
3551         \noexpand\eql@for@fn{##1}{\eql@for@varb}{\eql@for@vara}}%
3552       \eql@for@call##1}%
3553     }%
3554   }%
3555 }%

```

\eql@setkeys Our wrapper of keyval's \setkeys prepends the prefix eql@ to the category, and it expands the list argument once:

```

3556 \def\eql@setkeys#1#2{%
3557   \def\eql@tmp{\setkeys{eql@#1}}%
3558   \expandafter\eql@tmp\expandafter{#2}%
3559 }%

```

\eql@nextopt It can be convenient to add arguments to the following equations environment, e.g. \eql@nextopt@process towards defining modifier macros:

```

\eqnaddopt
3560 \let\eql@nextopt@\empty
3561 \def\eql@nextopt@process#1{%
3562 (dev)\eql@dev@start\eql@nextopt@process
3563   \eql@setkeys{#1}\eql@nextopt
3564   \let\eql@tagging@opt\eql@nextopt
3565   \global\let\eql@nextopt@\empty
3566 }%
3567 \newcommand{\eqnaddopt}[1]{%
3568   \expandafter\def\expandafter\eql@nextopt\expandafter{\eql@nextopt,#1}%

```

Q.3 Parameter Sets

Q.6 Global and Package Options

Handle global and package options:

\eqnlineset The macro \eqnlineset processes global configuration options including the package options:

```
4222 \newcommand{\eqnlineset}[1]{%
4223 <dev>\eql@dev@start\eqnlineset
4224   \eql@setkeys{setup}{#1}}
```

Disable error message for exclusive package options:

```
4225 \let\eql@error@packageoption@gobble
```

Pass undeclared options on to keyval processing:

```
4226 \DeclareOption*{\expandafter\eqnlineset\expandafter{\CurrentOption}}
```

Process package options:

```
4227 \ProcessOptions
```

@error@packageoption Enable error message for exclusive package options:

```
4228 \def\eql@error@packageoption#1{%
4229   \eql@error{may only use '#1' as a package option}%
4230 }
```

Provide classes of interfaces:

```
4231 \ifdefined\tagsleft@true\else
4232   \expandafter\newif\csname iftagsleft@\endcsname
4233 \fi
4234 \ifdefined\fleqntrue\else
4235   \expandafter\newif\csname if\fleqn\endcsname
4236 \fi
4237 \ifdefined\eql@provide@opt@amsmath
4238   \let\eql@provide@opt@equation\eql@true
4239   \eql@amsmath@after{%
4240     \iftagsleft@
4241       \eqnlineset{tagsleft}
4242     \else
4243       \eqnlineset{tagsright}
4244     \fi
4245     \if\fleqn
4246       \eqnlineset{left}
4247     \else
4248       \eqnlineset{center}
4249     \fi
4250   }
4251 \fi
```
